# Toxicity and chemical analysis of treated PW

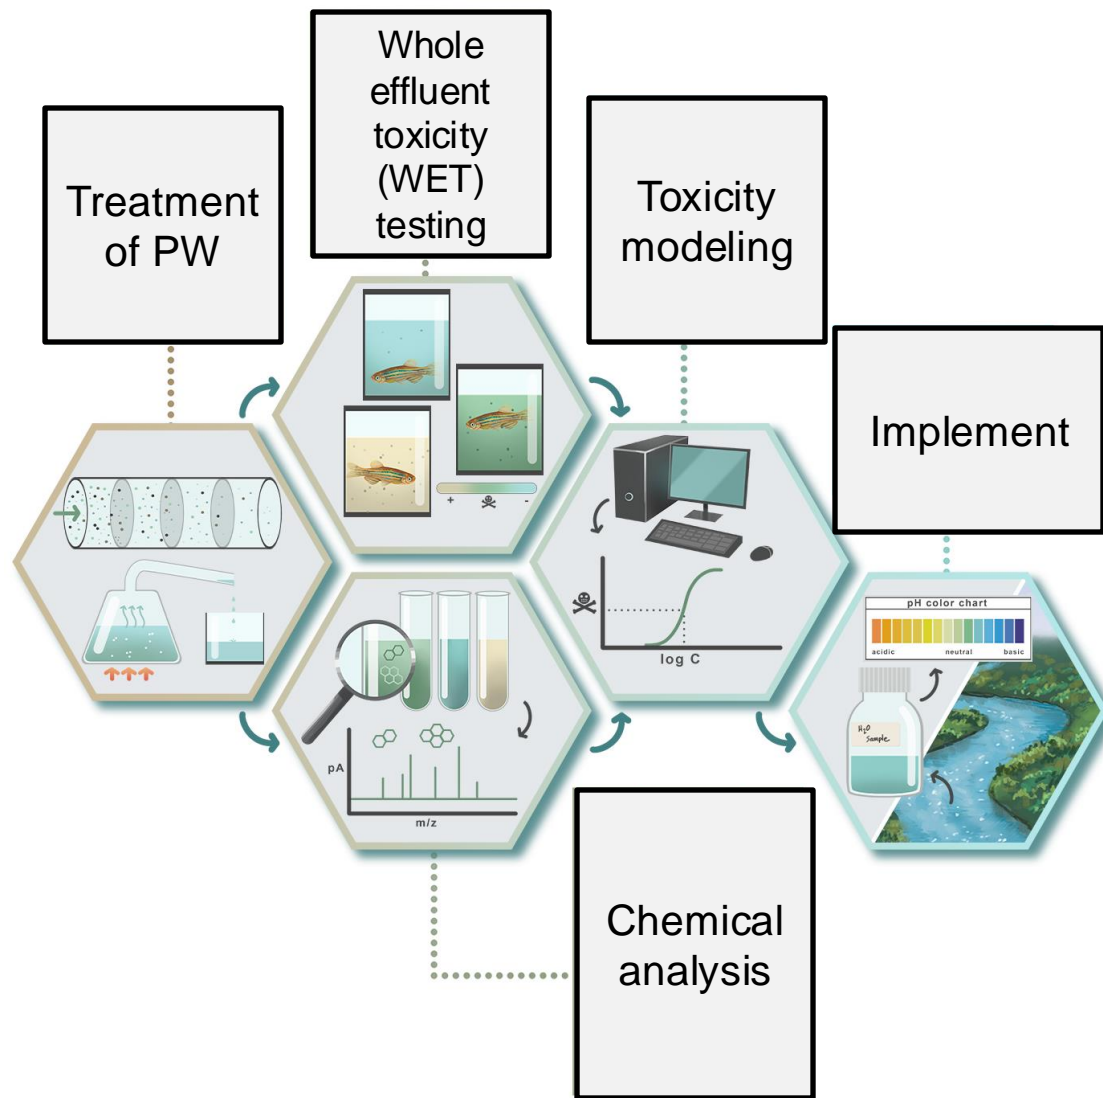

Energy lives here™

Aaron Redman (ExxonMobil Biomedical Sciences, Inc)

# Integrated analysis of treated PW: chemistry and toxicity

## Objective:

develop a methodology to identify relevant *constituents* and *toxicity tests* to support beneficial reuse of treated PW

Redman et al *submitted* 2024

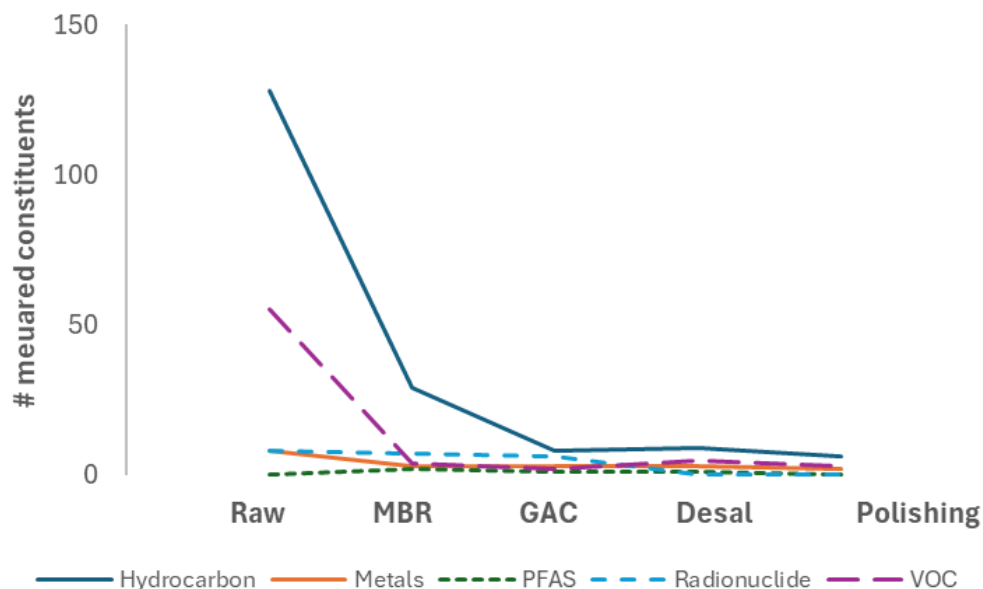

Van Houghton et al 2024

<https://pubs.acs.org/doi/abs/10.1021/acsestwater.3c00407>

# Summary of chemistry results

- Potential to streamline testing programs (400+ analytes)
  - Not detected in polished water: Acids, Alcohols, Dioxin, PCB, Pesticides
  - Subsets of chemistry could be used as surrogates (e.g., TPH, BTEX, ...)

Number of analytes above the reporting limits					
Category	Raw	Membrane bioreactor (MBR)	Granular activated carbon (GAC)	Desalination	Polishing to remove ammonia
Hydrocarbon	128	29	8	9	6
Metals	8	3	3	3	2
PFAS	0	2	1	1	1
Radionuclide	8	7	6	0	0
VOC	55	4	2	5	3

# Toxicity analysis

- Toxic units (TU)  
used to analyze  
mixture toxicity

$$TU = \sum \frac{C_W}{\text{Tox. Limit}}$$

# Toxicity analysis

- Toxic units (TU) used to analyze mixture toxicity

$$TU = \sum \frac{C_W}{\text{Tox. Limit}}$$

- TU decline >90% through treatment
- Ammonia is a likely stressor in this system

# Toxicity analysis

- Toxic units (TU) used to analyze mixture toxicity

$$TU = \sum \frac{C_W}{\text{Tox. Limit}}$$

- TU decline >90% through treatment
- Ammonia is a likely stressor in this system

Today.**

# Outline

- Data analysis workflow
- Chemical characterization
- Toxicity characterization

# Toxicity analysis

# Toxicity results

- WET test data appear consistent with ammonia toxicity in this system
